## How Computers Work

A computer is an electronic device that can be programmed to complete specific tasks Computers receive data, it is stored in primary memory where it can be accessed for processing, and it outputs new information.

## Types of Data

Computers need to be able to receive, store, process and output different types of data:

|  | Input or <br> Output | Numbers | Text |  | Images | Sound | Movement | Instructions |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: |
| Keyboard | Input | $\checkmark$ | $\checkmark$ |  |  |  | $\checkmark$ |  |
| Mouse | Input |  |  |  |  | $\checkmark$ | $\checkmark$ |  |
| Microphone | Input |  |  |  | $\checkmark$ |  |  |  |
| Scanner | Input | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |  |
| Touch Screen | Both |  |  |  |  | $\checkmark$ | $\checkmark$ |  |
| Monitor | Output | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |  |
| Speakers | Output |  |  |  | $\checkmark$ |  |  |  |
| Printer | Output | $\checkmark$ | $\checkmark$ | $\checkmark$ |  |  |  |  |
| Actuator | Output |  |  |  |  | $\checkmark$ |  |  |

## Converting Binary numbers to Decimal

Convert Binary numbers (Base 2) to Decimal (Base 10) by adding the column values

| 128 | $\mathbf{6 4}$ | $\mathbf{3 2}$ | $\mathbf{1 6}$ | $\mathbf{8}$ | $\mathbf{4}$ | $\mathbf{2}$ | $\mathbf{1}$ |  | Calculation |  | Decimal <br> Value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | $=$ | $8+1$ | $=$ | 9 |

## Converting Binary numbers to Hexadecimal

Hexidecimal is used in computing as a way of displaying binary code in a Hexadecimal Decimal way that is easier to read and spot mistakes. It also takes up less space on the screen than binary.

Split the binary sequence into nibbles

Convert each nibble into decima

Convert decimal number into hexadecimal

Join the hexadecimal numerals together
11111001 = F9

## American Standard Code for Information Interchange

## A method of encoding text as binary

Each character (including spaces and punctuation) is given a number between 0 and 255, this is converted to binary. Each character takes up 8 bits ( 1 byte).

| Character | ASCII Value |  | $\mathbf{1 2 8}$ | $\mathbf{6 4}$ | $\mathbf{3 2}$ | $\mathbf{1 6}$ | $\mathbf{8}$ | $\mathbf{4}$ | $\mathbf{2}$ | $\mathbf{1}$ |
| :---: | :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| E | 69 | $=$ | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 1 |
| e | 101 | $=$ | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 1 |

| Key Word | Definition |
| :--- | :--- |
| Binary | A term meaning that there are 2 possible states (e.g. OFF or ON). <br> Also refers to the Base 2 counting system. <br> Counts using to numerals (0 to 1). |
| BIOS | Basic Input/Output System. <br> The bootstrap system found on PCs, stored in non-volatile memory. |
| Bootstrap | Software that is stored permanently in the primary memory of an General <br> Purpose Computer, and contains the start-up instructions. |
| Decimal | The Base 10 counting system. <br> Counts using 10 numerals (0 to 9). |
| Embedded | A computer that is built into a device and performs one or more <br> specialised tasks, following the instructions stored in the firmware. |
| Computer | Software that is stored permanently in the primary memory of an <br> embedded computer and contains the instructions for how it operates. |
| General Purpose | A computer that is used for many different applications. It can run many <br> different pieces of software. |
| Computer | The physical parts of the computer |
| Hardware | The base 16 counting system. <br> Counts using 16 numerals (0 to F). |
| Hexadecimal | Does not need an electric current to keep the data stored in memory. |
| Non-Volatile <br> Memory | Hardware devices that are plugged in to a General Purpose Computer |
| Peripherals | The internal storage of a computer where data is stored ready for <br> processing. The processor has direct access to it. |
| Primary Storage | Considered external storage, used for long-time storage so must be non- <br> volatile. |
| Secondary |  |
| Storage | The programs that contain the instructions of the computer to follow |
| Software | Data is stored on integrated circuits that need an electric current to <br> maintain the data being stored. Data is lost/wiped when it is switched off. |
| Volatile Memory |  |
