## Encoding Data

For computers to process, store and send data, information or instructions, they must be converted to binary so that the computer can understand it.

## The Processor

The processor of a computer is made up of logic gates that either allow electricity to flow through them or they don't. There are only these two possibilities.

electricity not flowing

electricity flowing

When there are only two possibilities then we call this binary.
All data bust be encoded as binary to be processed by a computer.
The more complicated the data, such as text, pictures and sound, the more Binary Digits (bits) are needed to store the data, and the larger the file size.

| Units of Measurement | Text |  | Music on <br> iTunes | HD Movies <br> on Netfix |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{1}$ bit | A Binary Digit | - | - | - |
| $\mathbf{1}$ byte | 8 bits | 1 single letter | - | - |
| $\mathbf{1}$ kilobyte | 1024 bytes | 1 paragraph | - | - |
| $\mathbf{1}$ megabyte | 1024 kilobytes | 500 pages | 30 seconds | 1.2 seconds |
| $\mathbf{1}$ gigabyte | 1024 megabytes | 1,700 books | 115 songs | 20 minutes |
| $\mathbf{1}$ terabyte | 1024 gigabytes | $1,745,256$ books | 116,508 songs | 129 films |

## Converting Decimal numbers to Binary

To encode Decimal (Base 10) numbers to Binary we convert them to Base 2.

| 128 | $\mathbf{6 4}$ | $\mathbf{3 2}$ | $\mathbf{1 6}$ | $\mathbf{8}$ | $\mathbf{4}$ | $\mathbf{2}$ | $\mathbf{1}$ |  | Calculation |  | Decimal <br> Value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | $=$ | $4+1$ | $=$ | 5 |
| 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | $=$ | $64+16+4+1$ | $=$ | 85 |

## American Standard Code for Information Interchange

A method of encoding text as binary.
Each character (including spaces and punctuation) is given a number between 0 and 255, this is converted to binary. Each character takes up 8 bits ( 1 byte).

| Character | ASCII Value |  | 128 | 64 | 32 | 16 | $\mathbf{8}$ | $\mathbf{4}$ | 2 | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| D | 68 | $=$ | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 |
| d | 100 | $=$ | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |

## Raster Graphics

Often called a bitmap image.
By creating a grid of pixels we can create a black and white picture using pixels.
By recording all the black pixels as 1s and all the white pixels as Os we can store an image as binary.

| 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |
| 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 |
| 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| 0 | 1 | 0 | 1 | 1 | 0 | 1 | 0 |
| 0 | 1 | 0 | 1 | 1 | 0 | 1 | 0 |
| 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 |
| 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 |

## Colour Depth

The number of bits used to store the colour of each pixel.
The more bits per pixel increase the number of possible colours, but also increases the file size.

| 00 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Resolution

The resolution of an image is measured in Pixels Per Inch (PPI)
The higher the PPI, the better quality the image but the image will take up more memory.

| Key Word | Definition |
| :--- | :--- |
| Binary | A term meaning that there are 2 possible states (e.g. OFF or ON). <br> Also refers to the Base 2 counting system. <br> Counts using to numerals (0 to 1). |
| Decimal | The Base 10 counting system. <br> Counts using 10 numerals (0 to 9). |
| File Size | The amount of memory a file takes up when saved. |
| Pixel | Picture Element. <br> An individual block of colour that makes up a raster image. <br> The colour of each pixel is saved as a binary value. |
